Main activities

About the research centre or Inria department

The Inria Université Côte d’Azur center counts 36 research teams as well as 7 support departments. The center’s staff (about 500 people including 320 Inria employees) is made up of scientists of different nationalities (250 foreigners of 50 nationalities), engineers, technicians and administrative staff. 1/3 of the staff are civil servants, the others are contractual agents. The majority of the center’s research teams are located in Sophia Antipolis and Nice in the Alpes-Maritimes. Four teams are based in Montpellier and two teams are hosted in Bologna in Italy and Athens. The Center is a founding member of Université Côte d’Azur and partner of the I-site MUSE supported by the University of Montpellier.

Context

The research is in the framework of the project “5G Events Labs” to conceive and provide new 5G services in the framework of large-scale events like Olympic games. The projects involves also Orange, Ericsson, and CEA.

Assignment

Driven by the exponential growth in wireless data traffic, operators are increasingly considering denser, heterogeneous network (HetNet) deployments, overlaying the macro-cellular network with many small cell base stations (BS). However, CAPEX and OPEX considerations are making the operators turn to cheap, under-provisioned solutions for the backhaul support of small cells, making backhaul capacity a potential new bottleneck. To alleviate this bottleneck, recent work has proposed ‘caching-at-the-edge’ methods that cache popular content closer to the user to reduce the number of duplicate backhaul transmissions.

While a number of recent works consider the problem of caching at BSs or even user devices, these works are not addressing the complex interplay between caching and advanced communication techniques considered for beyond 4G networks, such as Coordinated Multi-Point (CoMP) transmission. In CoMP multiple BSs transmit the same content concurrently, aiming at diversity or multiplexing gains on the radio interface, at the cost of a significant additional overhead on the backhaul to retrieve the content at all the BSs involved. Hence, for edge caching to facilitate CoMP, the same content must be cached at all cooperating BSs.

We propose to jointly consider and optimize cooperative caching at the edge with cooperative communication techniques. A key goal in this proposal is to perform a first-of-its-kind exploration of the elusive tradeoff between edge caching that reduces backhaul traffic, and caching at the BSs that potentially improves radio access performance. At the center of this tradeoff lies the question of how caching algorithms can adapt to accommodate potential Coordinate Multi-Point (CoMP) transmission opportunities: caching the same replicated content in multiple nearby caches can exploit coordinated transmissions, but might waste valuable storage space and lead to cache misses; yet storing different contents to improve cache hits might lead to missing CoMP opportunities, and degrade communication performance.

To this end, we plan to investigate distributed implementations of our optimization solutions, in order to (a) deal with the high complexity of such cooperative caching problems, and (b) significantly reduce the amount of additional (signaling) information transmitted over the already congested backhaul links.

We started our investigation of the topic during the PhD of Guilherme lecker Ricardo. His thesis “Design and optimization of cache systems for small cell networks” is available at https://tel.archives-ouvertes.fr/tel-03574320 and provides many useful pointers to related work. A set of selected references is provided below. Our goal during the postdoc is to extend this research line taking into account the effect of concurrent users’ requests and dynamic resource allocation strategies.

About Inria

Inria is the French national research institute dedicated to digital science and technology. It employs 2,600 people. Its 200 agile project teams, generally run jointly with academic partners, include more than 3,500 scientists and engineers working to meet the challenges of digital technology, often at the interface with other disciplines. The Institute also employs numerous talents in very different professions. Inria’s research support staff contribute to the preparation and development of scientific and entrepreneurial projects that have a worldwide impact.

The keys to success

We are looking for a candidate with a strong background on performance evaluation of networks.

Background knowledge on Coordinated Multi-Point transmission techniques is a plus.

Instruction to apply

Defence Security :
This position is likely to be situated in a restricted area (ZRR), as defined in Decree No. 2011-1425 relating to the protection of national scientific and technical potential (PPST).Authorisation to enter an area is granted by the director of the unit, following a favourable Ministerial decision, as defined in the decree of 3 July 2012 relating to the PPST. An unfavourable Ministerial decision in respect of a position situated in a ZRR would result in the cancellation of the appointment.

Recruitment Policy :
As part of its diversity policy, all Inria positions are accessible to people with disabilities.

Warning : you must enter your e-mail address in order to save your application to Inria. Applications must be submitted online on the Inria website. Processing of applications sent from other channels is not guaranteed.
Beside pursuing the research directions described above, the postdoc can be involved in supervision of PhD and master students.

**Skills**
The working language is English.

**Benefits package**
- Subsidized meals
- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking (after 6 months of employment) and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Social security coverage

**Remuneration**
Gross Salary: 2653 € per month
