

**Offre n°2025-08736**

## **PhD Position F/M Latency-Driven container network optimization in edge industrial IoT**

*Le descriptif de l'offre ci-dessous est en Anglais*

**Type de contrat :** CDD

**Niveau de diplôme exigé :** Bac + 5 ou équivalent

**Fonction :** Doctorant

### **A propos du centre ou de la direction fonctionnelle**

The Inria Rennes - Bretagne Atlantique Centre is one of Inria's eight centres and has more than thirty research teams. The Inria Center is a major and recognized player in the field of digital sciences. It is at the heart of a rich R&D and innovation ecosystem: highly innovative PMEs, large industrial groups, competitiveness clusters, research and higher education players, laboratories of excellence, technological research institute, etc.

### **Mission confiée**

Cloud computing and its three facets (IaaS, PaaS and SaaS) have become essential in today Internet Applications, offering many advantages such as scalability, elasticity or flexibility. With its different service models, the cloud still faces many issues prone to impact either the end-user (QoS), the provider (Cost) and the environment (Sustainability).

The Edge computing is a paradigm that address such issues by provisioning resources outside the cloud and closer to the end-device, at the edge of the network. This allows to reduce the latency and minimize the traffic between end-user and the cloud platform [4]. Several studies have shown that edge systems can indeed reduce the latency compared to cloud systems, but this reduction is not guaranteed and will highly depend on the components placement, leading sometimes to worse performance [11]. It has been also demonstrated that less traffic is sent to the cloud when using edge systems. However, a lack of a proper monitoring or reconfiguration mechanism in the edge exists, especially when the application is related to the IoT [9], where the cloud infrastructure is known not to be a viable solution. Critical industrial IoT use case scenario, such as real-time manufacturing robot application or monitoring of critical equipment, leverage the adequacy of the edge paradigm that could mitigate the latency in such specific scenario.

However, evaluating realistic large-scale edge infrastructure constitute a complex task given the cost of deployment and the absence of a realistic view of the real-world deployments. In an IoT context, geo-distributed edge infrastructures mostly rely on SDN approaches[6] that contribute to conceal the networking aspects such as the topology or the routing decisions[10]. In consequence, it appears that the impact of the elasticity of a edge solution is mainly evaluated on the data plane side[5].

Moreover, standard container orchestration platforms, such as Kubernetes, rely on the Container Network Interface (CNI) to define the network requirements and manage the connectivity of containerized workloads. Consequently, the performance of the network is heavily influenced by the specific implementation of the CNI [3]. In latency-critical applications, dynamic changes in the network can significantly impact the responsiveness of the CNI, posing challenges for routing technologies. Segment Routing (SR) is one among multiple technologies that offers potential solutions to these challenges due to its adaptability to network changes. While some studies have explored the integration of SR with Kubernetes [8], they have predominantly focused on throughput metrics. There remains a significant research gap in addressing SR's implications for latency, which warrants further investigation.

In the context of IIoT applications (i.e. critical response time environments such as Manufacturing or Monitoring of critical equipment) latency is at the center of a tremendous number of studies to optimize the placement of resources in distributed architectures. To ensure that the quality of service is guaranteed, several solutions exist to reconfigure the components placement (migration) and can reduce the overall latency by changing the components and routes. However, knowing precisely which component is the source of the problematical latency remains scarcely addressed. When taking a decision for a reconfiguration or a migration, which can be triggered due to latency issue, it can be beneficial to check if the source of the latency can be solved before instantiating a migration or a full reconfiguration. Some studies exist where a comparison of response time is done between the major cloud actors depending on the load [7]. Proper measurement protocols exist but always refer to specific case studies [1, 2] and would not allow to be integrated in edge systems.

## Objectives:

The objective of this thesis is to study the optimization of the container network in Edge-based IIoT systems based on latency measurement, by evaluating the control plane cost of a change in the architecture. It will particularly address the problem of how to identify the origin of a latency issue, and based on this finding, propose a routing optimization that take into account the cost and elasticity of the control plane.

## Principales activités

- Explore the State-of-the-Art of the IoT/Edge Emulation/Simulation platforms
- Integrate an IIoT solution in a Edge architecture platform with a latency measurement
- Propose a profile and a classification of latency issues
- Through the use of Segment Routing, propose an innovative way to optimize CNI taking into account the latency metrics and the control plane capabilities

## Compétences

- A master degree in distributed systems and/or Cloud computing/Networking
- Good knowledge of distributed systems
- Good programming skills (e.g., C++ and Python)
- Basic knowledge of simulation
- Excellent communication and writing skills in English (Note that knowledge of French is appreciated but not required for this position)
- Knowledge of the following technologies is not mandatory but will be considered as a plus:
  - Cloud resource scheduling
  - Routing, Software Defined networks
  - Revision control systems: git, svn

- Linux distribution: Debian, Ubuntu

## Avantages

- Subsidized meals
- Partial reimbursement of public transport costs
- Leave: 7 weeks of annual leave + 10 extra days off due to RTT (statutory reduction in working hours) + possibility of exceptional leave (sick children, moving home, etc.)
- Possibility of teleworking (after 6 months of employment) and flexible organization of working hours
- Professional equipment available (videoconferencing, loan of computer equipment, etc.)
- Social, cultural and sports events and activities
- Access to vocational training
- Social security coverage

## Rémunération

monthly gross salary amounting to 2200 euros

## Informations générales

- **Thème/Domaine** : Systèmes distribués et intergiciels  
Système & réseaux (BAP E)
- **Ville** : Rennes
- **Centre Inria** : [Centre Inria de l'Université de Rennes](#)
- **Date de prise de fonction souhaitée** : 2025-09-01
- **Durée de contrat** : 3 ans
- **Date limite pour postuler** : 2025-05-14

## Contacts

- **Équipe Inria** : [MAGELLAN](#)
- **Directeur de thèse** :  
Lemerrier Francois / [francois.lemerrier@irisa.fr](mailto:francois.lemerrier@irisa.fr)

## A propos d'Inria

Inria est l'institut national de recherche dédié aux sciences et technologies du numérique. Il emploie 2600 personnes. Ses 215 équipes-projets agiles, en général

communes avec des partenaires académiques, impliquent plus de 3900 scientifiques pour relever les défis du numérique, souvent à l'interface d'autres disciplines. L'institut fait appel à de nombreux talents dans plus d'une quarantaine de métiers différents. 900 personnels d'appui à la recherche et à l'innovation contribuent à faire émerger et grandir des projets scientifiques ou entrepreneuriaux qui impactent le monde. Inria travaille avec de nombreuses entreprises et a accompagné la création de plus de 200 start-up. L'institut s'efforce ainsi de répondre aux enjeux de la transformation numérique de la science, de la société et de l'économie.

## L'essentiel pour réussir

Doing a PhD is a job unlike any other. Please read this document carefully to decide whether a PhD is the right career move for you:

<https://medium.com/great-research/do-you-need-a-ph-d-f78d2fb0f286>

**Attention:** Les candidatures doivent être déposées en ligne sur le site Inria. Le traitement des candidatures adressées par d'autres canaux n'est pas garanti.

## Consignes pour postuler

### **Sécurité défense :**

Ce poste est susceptible d'être affecté dans une zone à régime restrictif (ZRR), telle que définie dans le décret n°2011-1425 relatif à la protection du potentiel scientifique et technique de la nation (PPST). L'autorisation d'accès à une zone est délivrée par le chef d'établissement, après avis ministériel favorable, tel que défini dans l'arrêté du 03 juillet 2012, relatif à la PPST. Un avis ministériel défavorable pour un poste affecté dans une ZRR aurait pour conséquence l'annulation du recrutement.

### **Politique de recrutement :**

Dans le cadre de sa politique diversité, tous les postes Inria sont accessibles aux personnes en situation de handicap.
